

Smallest Gold - Cosmic Gold

Mars

Mercury

Earth

Moon

Vesta

Background

After the enormous success of silver coins with embedded meteorite pieces, the international demand for the extremely rare rocks has increased tremendously. Prices skyrocketed within a few months and silver issues registered massive rise in value, mainly because of the already limited resource of the meteorite splitters.

Even in this field of rarities there are some pieces that are even more sought after than the rest. Think of genuine pieces from the Moon or the Mars! These rocks are a billion of years old and originate from outer space.

Numiscom combines one of the most precious metals on Earth and the most rare and expensive stones from outer space, to create investor pieces.

Don't miss out on the first issue – **Red Planet Mars** - since first batches are already sold out and the soon-to-come issue of the second coin – **Moon** – will surely boost the remaining pieces of the red planet. Each gold coin is struck from .999 gold and minted in proof condition. The coins come housed in an informative folder with additional information on their home planets and are of course accompanied by a certificate of authenticity.

Specifications

- genuine pieces of Moon and Mars
- .999 gold in Proof
- mintage only 5 000 pcs worldwide
- informative display folder
- billion year old stones from outer space

Country:	Chad
